

- ⊙ Breads
- ⊙ Chapter 22
- ⊙ Page 383
- ⊙ Guide to Good Food textbook
- ⊙ Types of Breads
- ⊙ Quick Breads
 - > Prepared in short amount of time
 - > Leavened with a powder leavening agent
 - Baking powder
 - Baking soda
 - > Examples
 - Biscuits
 - Muffins
 - Popovers
 - Cream puffs
 - Waffles
 - Banana bread
- ⊙ Types of Breads
- ⊙ Yeast Breads
 - > Take more time
 - Kneading and rising time
 - > Leavened with gases formed from chemical reactions with yeast
 - > Examples
 - Loaf bread
 - Dinner rolls
 - English muffins
 - Cinnamon rolls
- ⊙ Selection
- ⊙ Freshly baked
 - > Bakery
- ⊙ Partially baked
 - > Brown-and-serve
- ⊙ Refrigerated
 - > Dough (rolled biscuits)
- ⊙ Frozen
 - > Dough or baked form
- ⊙ Cost
- ⊙ Convenience affects cost
 - > Brown-and-serve may cost more than a frozen dough
- ⊙ Buying sometimes still cheaper than making homemade
- ⊙ Price affected by:
 - > product
 - > size of product (large loafs may cost more but are cheaper per serving)

- > Brand
- > extra ingredients
- ⊙ Storage
- ⊙ Many bread products can be stored at room temperature
 - > Also in refrigerator or freezer
 - > Prevents mold but can dry bread
- ⊙ Frozen products need to be frozen
- ⊙ All bread products need to be stored tightly sealed, whether on counter or in freezer
- ⊙ Basic Ingredients
- ⊙ Flour
- ⊙ Leavening agents
- ⊙ Liquids
- ⊙ Fat
- ⊙ Eggs
- ⊙ Sugar
- ⊙ Salt
 - Each ingredient has a specific purpose
- ⊙ Flour
- ⊙ Give structure to baked products
 - > Created by 2 proteins in wheat flour
 - Gliadin and glutenin
 - > When flour is mixed with liquid, these proteins form gluten
 - Gluten gives strength and elasticity to dough
 - Gluten behaves in similar manner as bubble gum: at first is soft and easy to chew, then is elastic enough to blow bubbles, then so elastic it hurts your jaw to chew
- ⊙ Flour
- ⊙ Flour comes from cereal grains
 - > White wheat flours used most in baking
- ⊙ Classifications:
 - > Bread flour
 - > All-purpose flour
 - > Cake flour
 - All contain protein and starch, just in different amounts (bread has most proteins, cake least)
- ⊙ Use kind of flour recipe calls for
 - > 1 Cup cake flour = 1 Cup All purpose – 2 Tablespoons
- ⊙ Leavening Agents
- ⊙ Make baked products rise and become light and porous
 - > By producing gases
- ⊙ Leavening gases
 - > Air
 - Incorporated in by beating eggs and other ingredients in mixing process

- > Steam
 - Created by liquid in dough being heated
- > Carbon dioxide
 - Chemical reaction of ingredients
 - Yeast, baking powder, baking soda
- ⊙ Leavening Agents
- ⊙ Yeast
 - > Microscopic, single-celled plant
 - > When sugar added to yeast, yeast acts on the sugar
 - Sugar feeds yeast
 - Carbon dioxide and ethyl alcohol are made
 - This process is called FERMINTATION
 - > Forms of yeast
 - Compressed, active dry, fast rising
- ⊙ Leavening Agents
- ⊙ Baking soda
 - > An alkali
 - > When added to flour mixture and heated, carbon dioxide released
 - > Doesn't taste the best
 - An acid ingredient counters this
 - Buttermilk, brown sugar, vinegar, fruit or fruit juices
- ⊙ Leavening Agents
- ⊙ Baking powder
 - > Mixture of a dry or salt acid, baking soda, and a starch or flour
 - > Most are double-acting
 - > Release carbon dioxide when moistened and even more when heated
 - > Use exact amounts to prevent products from collapsing
 - > Liquids
- ⊙ Add moisture and help dry ingredients to dissolve or mix together
- ⊙ Hydrate proteins and starch in flour
 - > To form gluten from proteins
 - > For starch to gelatinize
- ⊙ Create steam during baking for rising
- ⊙ Examples are water, milk, and juices
 - > Eggs and fats sometimes liquids
 - > Fat
- ⊙ Tenderizing agent
 - > Separates flour particles into layers
- ⊙ Adds flavor
- ⊙ Aids in leavening
 - > Because of separating those flour particles
 - > Also because air bubble incorporated during beating process are trapped by fat
- ⊙ Eggs

- ⊙ Incorporate air in beating process
- ⊙ Add color and flavor
- ⊙ Contribute to structure
 - > Egg proteins coagulate when heated
 - > Adds elasticity and structure
- ⊙ Works as an emulsifier
 - > Makes things stick together
- ⊙ Sugar
- ⊙ Sweetness
- ⊙ Tenderizes
- ⊙ Helps crusts brown
- ⊙ In yeast breads:
 - > Feeds the yeast in fermentation process
- ⊙ Brown sugar:
 - > Usually interchangeable with white sugar
 - > Different flavor
 - > Gives more moisture than granulated sugar
- ⊙ Salt
- ⊙ Adds flavor
- ⊙ In yeast breads:
 - > Regulates yeast, preventing carbon dioxide from being produced too quickly
 - > This caused bread to be difficult to handle
 - > Also causes bread to have bad appearance
- ⊙ Quick Bread Mixing Methods
- ⊙ Most dough mixed by 1 of 3 methods:
 - > Biscuit method
 - > Muffin method
 - > Conventional cake (mixing) method
- ⊙ Biscuit Method
- ⊙ Used for biscuits and pastry
- ⊙ Dry ingredients sifted together over bowl
- ⊙ Fat cut in with pastry blender until resembled coarse cornmeal
- ⊙ Liquid added last
- ⊙ Muffin Method
- ⊙ Used for muffins, waffles, griddle cakes, popovers, and some coffee cakes
- ⊙ Dry ingredients sifted together
- ⊙ Beaten eggs combined with liquid and melted fat (ingredients at room temp.)
- ⊙ Liquid mixture added to dry
- ⊙ Batter stirred
- ⊙ Conventional Mixing Method
- ⊙ Used for shortened cakes, some coffee cakes, breads leavened with baking powder and some cookies
- ⊙ Fat and sugar creamed together

- > Beaten until light and fluffy
- ⊙ Beaten eggs added
- ⊙ Dry ingredients sifted in separate bowl and added to liquid
- ⊙ Preparation of Quick Breads
- ⊙ All quick breads have same ingredients in different proportions and mixed by different method
- ⊙ Gluten usually developed by stirring
 - > If mixed too much or over handled gluten will over develop
 - Bread will be compact and tough
- ⊙ Preparation of Biscuits
- ⊙ 2 types: rolled or dropped
- ⊙ Rolled biscuits:
 - > Rolled out
 - > Cut with biscuit cutter
 - > Soft dough
 - > Baked on ungreased baking sheet
- ⊙ Dropped biscuits
 - > Have more liquid
 - > Batter dropped from spoon on greased pan
- ⊙ Both mixed with biscuit mixing method
 - > Characteristics of Biscuits
- ⊙ High quality rolled biscuit:
 - > Even shape, smooth, level top
 - > Straight sides, even brown crust
 - > Inside in white/creamy white
 - > Crumbs are moist and fluffy
 - > Peel apart in layers
- ⊙ Undermixed biscuits:
 - > Low volume, rounded top
 - > Rough crust, tender crumbs
- ⊙ Overmixed biscuits:
 - > Low volume, rounded top
 - > Smooth top, tough and compact crumbs
- ⊙ Preparation of Muffins
- ⊙ Mixed by muffin method
- ⊙ May have other ingredients
 - > Fruits, nuts, cheese, etc.
- ⊙ Characteristics of Muffins
- ⊙ High quality muffins:
 - > Thin, evenly browned crust
 - > Top is symmetrical, looks rough
 - > Texture is uniform, crumbs tender and light
- ⊙ Undermixed muffins:

- > Low volume and flat top
 - > Crumbs are coarse
- ⊙ Overmixed muffins:
 - > Peaked top, pale, slick crust
 - > Tunnels inside (narrow, open air pockets)
- ⊙ Other Breads
- ⊙ See page 392 and 393 for preparation techniques for popovers and cream puffs
- ⊙ Read and summarize in space below
- ⊙ Popovers:
- ⊙ Cream Puffs:
- ⊙ Microwaving Quick Breads
- ⊙ Several can be baked in the microwave:
 - > Nut breads, muffins, coffee cakes, corn bread and biscuits
- ⊙ Other breads work well to prepare, freeze, and reheat in microwave:
 - > Waffles, griddle cakes
- ⊙ Popovers and cream puffs DO NOT microwave well, will not form crusts
- ⊙ Breads will not brown
- ⊙ Yeast Breads
- ⊙ All purpose flour works
- ⊙ Liquid
 - > Plain water, potato water or milk
 - > Need to be warm to activate yeast
 - > Recipes may state that milk should be scalded, but not necessary if using pasteurized milk
- ⊙ Yeast Breads
- ⊙ Yeast:
 - > Too much causes dough to rise too quickly
 - > Too much gives undesirable taste and look
 - > Too little yeast lengthens fermentation time
- ⊙ Yeast affected by temperature of liquid
 - > Too high kills yeast cells
 - > Too low slows down activity
- ⊙ Yeast Bread Mixing Methods
- ⊙ Yeast breads mixed by 1 of 4 methods:
 - > Straight-dough method
 - > Fast mixing method
 - > Sponge method
 - > Batter, or no-mix, method
- ⊙ Straight-dough Method
- ⊙ Yeast softened in warm water
 - > 80-85 degrees for compressed yeast
 - > 110-115 degrees for active dry or fast rising
- ⊙ Room temperature milk is used

- > Cold ingredients slow yeast activity
- ⊙ Sugar, fat, and salt added to milk
- ⊙ Yeast combined with liquid mixture
- ⊙ Part of flour added, mixed till smooth
- ⊙ Rest of flour added to form dough
- ⊙ Straight-dough Method
- ⊙ If using this method to prepare refrigerator yeast breads or rolls:
 - > Usually extra yeast, sugar and salt needed
 - > Dough is mixed, kneaded, and covered and put in refrigerator
 - > Heat from dough continues fermentation once in refrigerator
 - > Dough should double in size
 - > Dough shaped and baked next day
 - > Fast Mixing Method
- ⊙ Works well with active dry or fast rising yeast
- ⊙ Yeast mixed with other dry ingredients and some of the flour
- ⊙ Liquid & fat heated to 120-130 degrees
- ⊙ Heated liquid added to dry ingredients
- ⊙ Eggs & rest of flour added to form dough
- ⊙ Softening yeast not necessary
- ⊙ Sponge Method
- ⊙ Liquid, sugar, yeast & part of flour mixed
 - > This mixture called a *sponge*
- ⊙ Sponge becomes bubbly and light
- ⊙ Cooled melted fat, salt and rest of flour added to sponge to form dough
- ⊙ Batter Method
- ⊙ Recipes using this method use less flour
- ⊙ Yeast mixture is thinner than a dough
- ⊙ Modification of straight-dough method that eliminates kneading
 - > Gluten developed by stirring
- ⊙ Quickest mixing method
- ⊙ Yeast Bread Preparation
- ⊙ During mixing and kneading gluten develops
- ⊙ Yeast produces carbon dioxide which gives volume to bread
- ⊙ Careful measuring, sufficient kneading, controlled fermentation temperatures, right pan size and right baking temperatures all produce a successful yeast bread
- ⊙ Kneading
- ⊙ Once a yeast dough formed it must be kneaded
- ⊙ Most of gluten formed during kneading
- ⊙ Should be rhythmical
- ⊙ With fingers fold dough in half toward you
- ⊙ With heels of hands push against dough
- ⊙ Turn dough $\frac{1}{4}$ a turn, repeat process until dough is smooth and elastic
- ⊙ Kneading

- ⦿ Do not add too much extra flour when kneading
- ⦿ Too much flour makes dough stiff
- ⦿ Do not be too rough with dough
- ⦿ Too much pressure at beginning makes dough sticky and hard to handle
- ⦿ Too much pressure at end can tear dough or destroy gluten
- ⦿ Fermentation
- ⦿ After kneading dough needs to rest in a warm place
- ⦿ During resting yeast acts of sugar to form carbon dioxide and ethyl alcohol
- ⦿ This process is called *fermentation*
- ⦿ Alcohol evaporated during baking
- ⦿ Carbon dioxide causes bread to rise
- ⦿ Dough should at least double in volume
- ⦿ Fermentation
- ⦿ To test dough to see if it has doubled:
 - > Gently press 2 fingers into dough
 - > If an indentation remains dough has risen enough, if dough bounces back it hasn't
- ⦿ Fermentation times depends on kind and amount of yeast, temperature of room, and kind of flour used
- ⦿ Fast-rising yeast dough rises 50% faster
- ⦿ 80-85 degrees is optimal
- ⦿ Punch the Dough
- ⦿ Most dough needs punched down after it becomes light (after 1st rising)
- ⦿ This releases some of the carbon dioxide
- ⦿ Firmly push fist into dough to punch
- ⦿ Bring edges of dough to center and turn so smooth side is on top
- ⦿ May need 2nd rising time
- ⦿ Shaping
- ⦿ After punched down, divide into portions as directed by recipe
- ⦿ Use a sharp knife
- ⦿ Let rest 10 minutes after divided
- ⦿ To shape, gently pat dough flat to release large air bubbles
 - > Use fingers if needed to release air
- ⦿ Gently shape, seal dough by pinching ends and center seam
- ⦿ Let loaves rise
- ⦿ Baking
- ⦿ Times and temperatures will vary
- ⦿ Usually start is hot oven
- ⦿ During first few minutes of baking dough will rise dramatically
 - > This rapid rising is called *oven spring*
- ⦿ After oven spring occurs temperature may be reduced to prevent burning
- ⦿ Remove from pans immediately and place on cooling racks
- ⦿ Cool completely before slicing & storing
- ⦿ Characteristics

- ⦿ High quality loaf bread:
 - > Large volume, smooth, rounded top
 - > Golden brown
 - > Texture fine and uniform
 - > Crumbs tender and elastic with spring
- ⦿ Over or under worked yeast dough will have low volume
- ⦿ If rises too long top of loaf will be sunken and side will overhang, coarse texture
- ⦿ If doesn't rise long enough will have large cracks and be compact
- ⦿ Microwaving Yeast Breads
- ⦿ Frozen dough can be defrosted in microwave
- ⦿ Loaf bread can rise and be baked in microwave but will lack crisp, brown crusts
- ⦿ Batter bread work better because of lack of crust
- ⦿ Variations
- ⦿ Using different flours
- ⦿ Dried fruit, nuts, herbs or cheeses
- ⦿ Tops can be brushed with butter
- ⦿ Different shapes and sizes can be used
